Why choose LINEA?

- Made-to-Measure
- Pivot Door with Magnetic Closing
- Customise Profile Colour
- Customise Glass Colour and Texture
- Anti-Limescale Treatment
- Engineered to comply with strict Euro Standards
- 78 years of engineering heritage and expertise
- Made in Italy
- Standard 2-Year Warranty
- Ideal for installation in Residential and Hospitality developments

What makes Vismaravetro shower enclosures special?

TPA

Vismaravetro uses an innovative technology known as "TPA" for protecting the glass surfaces of shower enclosures.

The glass surface is treated with a nanotechnology which limits the adhesive properties of residues such as limescale, grease and soap deposits. The TPA treatment helps with the cleaning and removal of the limescale deposits and residues from the glass.

How to clean the glass surfaces treated with TPA

- If possible always dry the shower enclosure after use
- Use a wet soft cloth when cleaning the glass
- The cleaning is made easier by a glass rubber wiper

Choose Vismaravetro Italian shower enclosures for your premium bathrooms

Design Professionals can today pen Vismaravetro shower enclosure/screen specifications into their design plans. Make Vismaravetro your preferred brand of premium shower enclosures/screens and start differentiating your projects to make them stand out from the rest.

**Ultimate
Strength!**

PROFILES

All profiles are made by primary alloy EN AW-6060 extruded aluminium. The colours reproduced are indicative and may differ from the original ones.

Anodisation *

Anodizing, also called anodic oxidation, is a non-spontaneous electrochemical process by which a protective oxide layer forms on the surface of the treated metal. Such anodization of aluminium is a process with a double anticorrosive and aesthetic function.

Multilayer enamelling **

New finishes made with an innovative technology studied in collaboration with one important company international leader in paints for aluminum. They have been tested for a long time in the laboratory and in salt-fog rooms, with excellent results in terms of aesthetic performance and of resistance over time.

This technology is used for 34 Matt Copper and 35 Matt Gold.

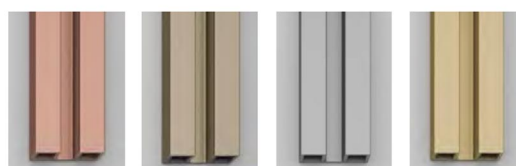

Epoxy enamelling ***

The enamelling of the profiles is done by covering them with epoxy enamels adhering to them by electrostatic effect. The profiles are then passed into an oven where, due to the temperature, the paint first melt and then polymerizes, giving an adherent layer with a double anticorrosive and aesthetic function.

materials and finishes

By using different materials, subjected to different and specific production processes and treatments, the finish varies from one component of the product to another.

Furthermore, the structure and the geometric shape of the components and the lighting conditions can show different shades even when the same materials and treatments are used.

SAFETY TEMPERED GLASS

Monolithic glasses of thickness 4 or 6 or 8 or more, processed by controlled thermal treatments to increase strength compared with normal glass. In case of breakage, they fragment into very small pieces, with sides not sharp, such as not to cause harm to people. They meet with EN 14428: 2018 standard and comply with the required certifications.
